Association of Vitiligo and Halo Nevus

Associação entre Vitiligo e Halo Nevo

Cátia R. Correia¹, Eugénia Matos Pires², Margarida Moura Valejo Coelho², Maria João Paiva Lopes²

KEYWORDS: Nevus, Halo; Vitiligo
PALAVRAS-CHAVE: Halo Nevo; Vitiligo

An 8-year-old boy presented for evaluation of a hypopigmented halo which developed around the congenital melanocytic nevus (CMN), with one year of evolution (Fig. 1). Three months later, hypopigmented patches developed in the upper eyelids (Fig. 2). On physical examination, the CMN, surrounded by a depigmented ring, with a total diameter of 5 mm in the posterior cervical region, was associated with hypopigmented patches of irregular and well-defined borders, symmetrically located in the upper eyelids. The nevus was asymptomatic and symmetric in colour and shape with regular margin. The diagnosis of halo congenital melanocytic nevus associated with vitiligo was established and topical tacrolimus 0.1% was instituted (twice a day).

Halo nevus is a benign, mostly acquired, melanocytic nevus surrounded by a halo of depigmentation.¹ The incidence of halo nevus in the population is estimated to be 1%.² Vitiligo is an acquired dermatosis characterized by the development of depigmented macules resulting from the progressive loss of melanocytes.¹

In our patient, the diagnosis of benign halo nevus and focal vitiligo was made by innocent clinical appearance of the halo (regular around the nevus) and the CMN characteristics (symmetry in the edges, colour and diameter). However, one the major differential diagnosis of the halo nevus is the malignant melanoma and, therefore, a histopathology examination maybe necessary to rule out that diagnosis.²

Although the pathogenesis of halo phenomenon and vitiligo remains uncertain, it has been thought that there are common autoimmune mechanisms, mediated by cytotoxic T-lymphocytes and antibodies to melanocytes, causing depigmentation of the affected skin.¹³

Guidelines for the treatment of these cases are scarce
and inconsistent.\textsuperscript{3,4} The resolution of vitiligo after excision of CMN is not an expected outcome, with only some prior reports describing that.\textsuperscript{3} Additionally, the mechanism of vitiligo improvement in these cases is not clear.\textsuperscript{3} On the other hand, some authors suggest that benign halo nevus associated with focal vitiligo could be effectively and safely treated with topical tacrolimus.\textsuperscript{4}

CONFLICTS OF INTEREST: The authors declare that they have no conflicts of interest.

FINANCIAL SUPPORT: This work has not received any contribution, grant or scholarship.

CONFIDENTIALITY OF DATA: The authors declare that they have followed the protocols of their work center on the publication of data from patients.

PATIENT CONSENT: Guardian consent obtained.

PROTECTION OF HUMAN AND ANIMAL SUBJECTS: The authors declare that the procedures followed were in accordance with the regulations of the relevant clinical research ethics committee and with those of the Code of Ethics of the World Medical Association (Declaration of Helsinki).

CONFLITOS DE INTERESSE: Os autores declararam não ter qualquer conflito de interesse na realização do presente trabalho.

FONTE DE FINANCIAMENTO: Não houve qualquer fonte de financiamento na realização do presente trabalho.

CONFIDENTIALIDADE DOS DADOS: Os autores declararam ter seguido os protocolos da sua instituição acerca da publicação dos dados de doentes.

CONSENTIMENTO DO DOENTE: Obtido o consentimento do tutor legal.

PROTEÇÃO DE PESSOAS E ANIMAIS: Os autores declararam que os procedimentos seguidos na elaboração do presente trabalho estão em conformidade com as normas das comissões de investigação clínica e de ética, bem como da declaração de Helsinquia e da Associação Médica Mundial.
